

Empathy Map

1. Brainstorming & Ideation | Credit Card Approval Prediction

Prepared For	Prepared By	Domain	Date
Credit Card Approval Prediction	Ankitha Vana	Finance	July 1, 2026

Purpose

Banks and financial institutions receive thousands of credit card applications every day. Manual review becomes slow and error-prone when analysts must inspect income type, employment duration, credit history, overdue behavior, and demographic signals for every applicant. This project automates the initial approval screening using supervised machine learning and presents the prediction through a Flask web interface.

The empathy map captures what the main users say, think, do, and feel while handling credit card eligibility decisions.

Primary User: Bank Credit Analyst

Says	Thinks	Does	Feels
I need to process applications quickly without missing risky cases.	A wrong approval can become a financial loss; a wrong rejection can hurt customer trust.	Reviews applicant income, employment details, family status, housing type, and credit history.	Pressured by high volume, deadlines, and the need for accurate decisions.

Secondary Users

User	Need	Pain Point	Expected Gain
Compliance Officer	Identify high-risk applicants and overdue payment patterns.	Manual checks across records are inconsistent and hard to audit.	Consistent risk classification and traceable prediction records.
Prospective Customer	Check likely eligibility before applying.	Repeated rejections reduce confidence and may affect future financial planning.	Instant eligibility guidance through a simple web form.

- Key pain: reviewing thousands of applications manually is slow.
- Key opportunity: use historical application and credit behavior data to support faster screening.
- Key design principle: prediction output must be simple, explainable, and usable by non-technical staff.
